

Lazy Day Challenge

Name : Hrishik

Roll no: cs23b1083

Brief Write-up

Problem I'm solving (or the lazy inspiration behind it)

The inspiration behind "**The Ultimate Run**" is a feeling I know all too well: the profound laziness that sets in when I'm comfortable in my room, yet a sudden craving for a snack strikes. We have lifts, but even the brief journey—walking, waiting, riding, and then walking to the ultimate store—feels like a monumental effort. My project solves this problem by automating the process of getting essentials from the store. It allows a student, like me, to satisfy their cravings without ever having to leave their room.

How it works (tools, technologies, approach)

I built this project as a web application using the Flask framework in Python. The application uses a simple SQLite database to store all requests, including the requestor's name, room number, contact, the list of items, and an optional tip.

The system works like this:

1. I, as a "requester," fill out a form with my order and personal details.
2. This request is then saved in the database with an 'Open' status.
3. Any other student, acting as a "helper," can view all the 'Open' requests.
4. A helper who is already on their way up from the ultimate store can select my request, fill in their own details, and accept it.
5. Upon acceptance, the request's status is updated to 'Accepted' in the database, and the helper's information is attached to the request.
6. I can then see that my request has been picked up, along with the contact information of my helper, which makes it easy to coordinate the delivery.

This application effectively automates the communication and coordination process that would otherwise require manual effort, such as shouting down the hall or using a messaging app.

Any unique or funny features

The most unique and funny feature is the "Lazy Factor" itself, which is the entire premise of my project. It turns a common, relatable feeling of laziness into a community-driven solution.

Another key feature is the optional tip system, which adds a fun, gamified element and provides a tangible incentive for helpers to accept requests. This transforms a simple act of kindness into a mutually beneficial exchange, making the entire process more reliable.
